## Differential Geometry HW

### 1.1 HW 3

#### Question 1

Let  $V$  be a finite dimensional vector space over  $\mathbb{R}$ . Show that for

$$\dim(V) < 4$$

Every non-zero element of  $\bigwedge^2(V)$  can be expressed as a wedge product of two vectors in  $V$ . Give an example to show that this is not true if  $\dim(V) = 4$ .

**Theorem 1.1.1. (Case of Zero and One Dimension)** If

$$\dim(V) \leq 1$$

Then every non-zero element of  $\bigwedge^2(V)$  can be expressed as a wedge product of two vectors in  $V$ .

*Proof.* Recall

$$\dim\left(\bigwedge^2(V)\right) = \binom{\dim(V)}{2} = 0$$

This implies  $\bigwedge^2(V) = 0$ . There does not exist non-zero element of  $\bigwedge^2(V)$ , rendering the proposition vacuously true. ■

**Theorem 1.1.2. (Case of Two Dimension)** If

$$\dim(V) = 2$$

Then every non-zero element of  $\bigwedge^2(V)$  can be expressed as a wedge product of two vectors in  $V$ .

*Proof.* Let  $\{e_1, e_2\}$  be a basis for  $V$ . We have

$$\bigwedge^2(V) = \text{span}\{e_1 \wedge e_2\}$$

Therefore, for all  $\omega \in \bigwedge^2(V)$ , we have

$$\omega = c(e_1 \wedge e_2) = (ce_1) \wedge e_2 \text{ for some } c \in \mathbb{R}$$

■

**Theorem 1.1.3. (Case of Three Dimensions)** If

$$\{e_1, e_2, e_3\} \text{ is a basis for } V$$

Then every non-zero element of  $\bigwedge^2(V)$  can be expressed as a wedge product of two vectors in  $V$ .

*Proof.* We know  $\bigwedge^2(V)$  have the following basis

$$\{e_1 \wedge e_2, e_1 \wedge e_3, e_2 \wedge e_3\}$$

Therefore, for arbitrary  $\omega \in \bigwedge^2(V)$ , we may express

$$\omega = \omega_1(e_1 \wedge e_2) + \omega_2(e_1 \wedge e_3) + \omega_3(e_2 \wedge e_3) \text{ for some } \omega_1, \omega_2, \omega_3 \in \mathbb{R}$$

Write  $\mathbf{x} = (\omega_3, -\omega_2, \omega_1) \in \mathbb{R}^3$ . By premise,  $\mathbf{x} \neq \mathbf{0}$ . Using Gram-Schmidt algorithm, we know there exists some  $\mathbf{a} = (a_1, a_2, a_3), \mathbf{b} = (b_1, b_2, b_3) \in \mathbb{R}^3$  such that

$$|\mathbf{a}| = |\mathbf{b}| = 1 \text{ and } \{\mathbf{x}, \mathbf{a}, \mathbf{b}\} \text{ are orthogonal}$$

The orthogonality of  $\{\mathbf{x}, \mathbf{a}, \mathbf{b}\}$  implies

$$\mathbf{x} = c\mathbf{a} \times \mathbf{b} \text{ for some } c \in \mathbb{R}$$

Explicitly,

$$\begin{cases} \omega_1 = \mathbf{x}_3 = c(a_1b_2 - a_2b_1) \\ \omega_2 = -\mathbf{x}_2 = c(a_1b_3 - a_3b_1) \\ \omega_3 = \mathbf{x}_1 = c(a_2b_3 - a_3b_2) \end{cases}$$

We now see

$$\begin{aligned} & [c(a_1e_1 + a_2e_2 + a_3e_3)] \wedge (b_1e_1 + b_2e_2 + b_3e_3) \\ &= c(a_1b_2 - a_2b_1)(e_1 \wedge e_2) + c(a_1b_3 - a_3b_1)(e_1 \wedge e_3) + c(a_2b_3 - a_3b_2)(e_2 \wedge e_3) \\ &= \omega_1(e_1 \wedge e_2) + \omega_2(e_1 \wedge e_3) + \omega_3(e_2 \wedge e_3) = \omega \end{aligned}$$

We have shown

$$\omega = (ca_1e_1 + ca_2e_2 + ca_3e_3) \wedge (b_1e_1 + b_2e_2 + b_3e_3)$$

That is,  $\omega$  can indeed be expressed as a wedge product of two vectors in  $V$ . ■

**Theorem 1.1.4. (Case of Four Dimensions)** If

$$\{e_1, e_2, e_3, e_4\} \text{ is a basis for } V$$

Then  $e_1 \wedge e_2 + e_3 \wedge e_4$  can not be expressed as a wedge product of two vectors in  $V$ .

*Proof.* Assume for a contradiction that for some  $(a_1, a_2, a_3, a_4), (b_1, b_2, b_3, b_4) \in \mathbb{R}^4$ , we have

$$e_1 \wedge e_2 + e_3 \wedge e_4 = (a_1e_1 + a_2e_2 + a_3e_3 + a_4e_4) \wedge (b_1e_1 + b_2e_2 + b_3e_3 + b_4e_4) \quad (1.1)$$

Equating the coefficients of  $e_1 \wedge e_2$ , we have

$$a_1b_2 - a_2b_1 = 1$$

This implies that one of  $a_1, b_1$  is non-zero. WLOG, suppose  $a_1 \neq 0$ . Now, equating the coefficients of  $e_1 \wedge e_3$  and  $e_1 \wedge e_4$ , we have

$$a_1b_3 - a_3b_1 = 0 = a_1b_4 - a_4b_1$$

Dividing  $a_1$ , we may deduce

$$b_3 = \frac{a_3b_1}{a_1} \text{ and } b_4 = \frac{a_4b_1}{a_1}$$

Therefore, the coefficients of  $e_3 \wedge e_4$  in the right side expression of Equation 1.1 is

$$a_3b_4 - a_4b_3 = \frac{a_3a_4b_1}{a_1} - \frac{a_4a_3b_1}{a_1} = 0$$

which does not equals to 1, the coefficient of  $e_3 \wedge e_4$  in the left side expression of Equation 1.1. This cause a contradiction. ■

## Question 2

Let  $\alpha$  be the 1-form  $dz + xdy$  on  $\mathbb{R}^3$ .

- (a) Find a basis for  $\text{Ker } \alpha$ .
- (b) Compute  $\alpha \wedge d\alpha$ .
- (c) Find the vector field  $R$  that satisfies  $\alpha(R) = 1$  and  $\iota_R d\alpha = 0$ .

(d) Let  $R$  be the same vector field as in (c), and let  $\varphi_t : \mathbb{R}^3 \rightarrow \mathbb{R}^3$  denote its flows. Compute  $\mathcal{L}_R \alpha$  and  $\varphi_t^* \alpha$  for all fixed  $t$ .

**Theorem 1.1.5.** (a) For all  $\mathbf{x} = (x, y, z) \in \mathbb{R}^3$ , the kernel of  $\alpha_{\mathbf{x}} : T_{\mathbf{x}}\mathbb{R}^3 \rightarrow \mathbb{R}$  has the basis

$$\left\{ \frac{\partial}{\partial x} \Big|_{\mathbf{x}}, \frac{\partial}{\partial y} \Big|_{\mathbf{x}} - x \frac{\partial}{\partial z} \Big|_{\mathbf{x}} \right\}$$

*Proof.* Let

$$c_1 \frac{\partial}{\partial x} \Big|_{\mathbf{x}} + c_2 \frac{\partial}{\partial y} \Big|_{\mathbf{x}} + c_3 \frac{\partial}{\partial z} \Big|_{\mathbf{x}} \in \text{Ker } \alpha_{\mathbf{x}}$$

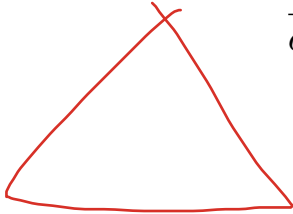

Compute

$$\begin{aligned} 0 &= \alpha_{\mathbf{x}} \left( c_1 \frac{\partial}{\partial x} \Big|_{\mathbf{x}} + c_2 \frac{\partial}{\partial y} \Big|_{\mathbf{x}} + c_3 \frac{\partial}{\partial z} \Big|_{\mathbf{x}} \right) = (dz + xdy) \left( c_1 \frac{\partial}{\partial x} \Big|_{\mathbf{x}} + c_2 \frac{\partial}{\partial y} \Big|_{\mathbf{x}} + c_3 \frac{\partial}{\partial z} \Big|_{\mathbf{x}} \right) \\ &= c_3 + xc_2 \end{aligned}$$

This implies

$$\frac{\partial}{\partial x} \Big|_{\mathbf{x}}, \frac{\partial}{\partial y} \Big|_{\mathbf{x}} - x \frac{\partial}{\partial z} \Big|_{\mathbf{x}} \in \text{Ker } \alpha_{\mathbf{x}}$$

Because

$$\alpha_{\mathbf{x}} \frac{\partial}{\partial z} \Big|_{\mathbf{x}} = 1$$

We know  $\text{Im}(\alpha_{\mathbf{x}}) = \mathbb{R}$ . Therefore,

$$\dim(\text{Ker } \alpha_{\mathbf{x}}) = 3 - \dim(\text{Im } \alpha_{\mathbf{x}}) = 2$$

It is clear that

$$\left\{ \frac{\partial}{\partial x} \Big|_{\mathbf{x}}, \frac{\partial}{\partial y} \Big|_{\mathbf{x}} - x \frac{\partial}{\partial z} \Big|_{\mathbf{x}} \right\} \subseteq \text{Ker } \alpha_{\mathbf{x}} \text{ is linearly independent}$$

It then follows that

$$\left\{ \frac{\partial}{\partial x} \Big|_{\mathbf{x}}, \frac{\partial}{\partial y} \Big|_{\mathbf{x}} - x \frac{\partial}{\partial z} \Big|_{\mathbf{x}} \right\} \text{ is indeed a basis for } \text{Ker } \alpha_{\mathbf{x}}$$

■

**Theorem 1.1.6.** (b)

$$\alpha \wedge d\alpha = dx \wedge dy \wedge dz$$

*Proof.* Compute

$$\begin{aligned} d\alpha &= d(dz + xdy) \\ &= d^2z + dx \wedge dy + xd^2y \\ &= dx \wedge dy \end{aligned}$$

Compute

$$\begin{aligned} \alpha \wedge d\alpha &= (dz + xdy) \wedge (dx \wedge dy) \\ &= dz \wedge dx \wedge dy + xdy \wedge dx \wedge dy \\ &= dx \wedge dy \wedge dz \end{aligned}$$

■

**Theorem 1.1.7.** (c)

$R \triangleq \frac{\partial}{\partial z}$  is the unique vector field that satisfies  $\alpha(R) = 1$  and  $\iota_R d\alpha = 0$

*Proof.* Suppose

$$R \triangleq R^1 \frac{\partial}{\partial x} + R^2 \frac{\partial}{\partial y} + R^3 \frac{\partial}{\partial z} \text{ satisfies } \alpha(R) = 1 \text{ and } \iota_R d\alpha = 0$$

For all  $V \in \mathfrak{X}(\mathbb{R}^3)$ , if we write

$$V = V^1 \frac{\partial}{\partial x} + V^2 \frac{\partial}{\partial y} + V^3 \frac{\partial}{\partial z}$$

Then

$$\begin{aligned} \begin{vmatrix} R^1 & V^1 \\ R^2 & V^2 \end{vmatrix} &= \begin{vmatrix} dxR & dxV \\ dyR & dyV \end{vmatrix} = (dx \wedge dy)(R, V) \\ &= d\alpha(R, V) = \iota_R d\alpha(V) = 0 \end{aligned} \tag{1.2}$$

If any of  $R^1$  or  $R^2$  is non-zero at some point  $p \in \mathbb{R}^3$ , by setting  $V^1 = -R^2$  and  $V^2 = R^1$  at  $p$  we have

$$\begin{vmatrix} R^1 & V^1 \\ R^2 & V^2 \end{vmatrix} \text{ is non-zero at } p$$

which contradicts to **Equation 1.2**. Therefore, we must have  $R^1 = R^2 = 0$  on  $\mathbb{R}^3$ . We may now compute

$$1 = \alpha(R) = (dz + xdy)(R^3 \frac{\partial}{\partial z}) = R^3$$

We may now conclude

$$R = \frac{\partial}{\partial z}$$

■

**Theorem 1.1.8.** (d) For all fixed  $t$ ,

$$\varphi_t^* \alpha = \alpha$$

And

$$\mathcal{L}_R \alpha = 0$$

*Proof.* Fix  $t$ . Obviously,

$$\varphi_t(x, y, z) = (x, y, z + t)$$

Let  $p = (x_0, y_0, z_0) \in \mathbb{R}^3$  and

$$v = v^1 \frac{\partial}{\partial x} \Big|_p + v^2 \frac{\partial}{\partial y} \Big|_p + v^3 \frac{\partial}{\partial z} \Big|_p \in T_p \mathbb{R}^3$$

Denote  $(x_0, y_0, z_0 + t)$  by  $q$ . Compute

$$\begin{aligned} (\varphi_t^* \alpha)_p(v) &= \alpha_q((\varphi_t)_* v) \\ &= \alpha_q \left( v^1 \frac{\partial}{\partial x} \Big|_q + v^2 \frac{\partial}{\partial y} \Big|_q + v^3 \frac{\partial}{\partial z} \Big|_q \right) \\ &= (dz + x_0 dy) \left( v^1 \frac{\partial}{\partial x} \Big|_q + v^2 \frac{\partial}{\partial y} \Big|_q + v^3 \frac{\partial}{\partial z} \Big|_q \right) \\ &= v^3 + x_0 v^2 \\ &= (dz + x_0 dy) \left( v^1 \frac{\partial}{\partial x} \Big|_p + v^2 \frac{\partial}{\partial y} \Big|_p + v^3 \frac{\partial}{\partial z} \Big|_p \right) \\ &= \alpha_p(v) \end{aligned}$$

We have shown  $(\varphi_t^* \alpha)_p = \alpha_p$ . Because  $p$  is arbitrary, this implies  $\varphi_t^* \alpha = \alpha$ . We may now compute

$$\mathcal{L}_R \alpha = \lim_{t \rightarrow 0} \frac{(\varphi_t^* \alpha)_p - \alpha_p}{t} = \lim_{t \rightarrow 0} \frac{0}{t} = 0$$

■

### Question 3

Orient  $S^n$  in  $\mathbb{R}^{n+1}$  as the boundary of the unit closed ball.

(a) Show that a volume form on  $S^n$  is

$$\omega = \sum_{i=1}^{n+1} (-1)^{i-1} \mathbf{x}^i d\mathbf{x}^1 \wedge \cdots \wedge \widehat{d\mathbf{x}^i} \wedge \cdots \wedge d\mathbf{x}^{n+1}$$

where the caret  $\widehat{\phantom{x}}$  over  $d\mathbf{x}^i$  indicates that  $d\mathbf{x}^i$  is to be omitted.

(b) Show that on  $S^2$

$$\omega = \begin{cases} \frac{dy \wedge dz}{x} & \text{for } x \neq 0 \\ \frac{dz \wedge dx}{y} & \text{for } y \neq 0 \\ \frac{dx \wedge dy}{z} & \text{for } z \neq 0 \end{cases}$$

(c) Calculate  $\int_{S^2} \omega$

**Theorem 1.1.9.** (a) Show that a volume form on  $S^n$  is

$$\omega = \sum_{i=1}^{n+1} (-1)^{i-1} \mathbf{x}^i d\mathbf{x}^1 \wedge \cdots \wedge \widehat{d\mathbf{x}^i} \wedge \cdots \wedge d\mathbf{x}^{n+1}$$

where the caret  $\widehat{\phantom{x}}$  over  $d\mathbf{x}^i$  indicates that  $d\mathbf{x}^i$  is to be omitted.

*Proof.* Let  $i : S^n \rightarrow \mathbb{R}^{n+1}$  be the inclusion map and define  $V \in \mathfrak{X}(\mathbb{R}^{n+1})$  by

$$V_{\mathbf{y}} \triangleq \sum_{i=1}^{n+1} \mathbf{y}^i \frac{\partial}{\partial \mathbf{x}^i} \Big|_{\mathbf{y}}$$

So that  $V$  is nowhere tangent to  $S^n$ . By Proposition 15.21 of "Introduction to Smooth Manifold" by John Lee, we know

$$i^*(\iota_V d\mathbf{x}^1 \wedge \cdots \wedge d\mathbf{x}^{n+1}) \text{ is a volume form on } S^n$$

Compute

$$\begin{aligned}
i^*(\iota_V d\mathbf{x}^1 \wedge \cdots \wedge d\mathbf{x}^{n+1}) &= i^* \left( \sum_{i=1}^{n+1} (-1)^{i-1} V^i d\mathbf{x}^1 \wedge \cdots \wedge \widehat{d\mathbf{x}^i} \wedge \cdots \wedge d\mathbf{x}^{n+1} \right) \\
&= \sum_{i=1}^{n+1} (-1)^{i-1} (V^i \circ i) d(\mathbf{x}^1 \circ i) \wedge \cdots \wedge \widehat{d\mathbf{x}^i} \wedge \cdots \wedge d(\mathbf{x}^{n+1} \circ i) \\
&= \sum_{i=1}^{n+1} (-1)^{i-1} V^i d\mathbf{x}^1 \wedge \cdots \wedge \widehat{d\mathbf{x}^i} \wedge \cdots \wedge d\mathbf{x}^{n+1} \\
&= \sum_{i=1}^{n+1} (-1)^{i-1} \mathbf{x}^i d\mathbf{x}^1 \wedge \cdots \wedge \widehat{d\mathbf{x}^i} \wedge \cdots \wedge d\mathbf{x}^{n+1} = \omega
\end{aligned}$$

We have shown

$$\omega = i^*(\iota_V d\mathbf{x}^1 \wedge \cdots \wedge d\mathbf{x}^{n+1})$$

This implies  $\omega$  is indeed a volume form on  $S^n$ . ■

**Theorem 1.1.10.** (b) Show that on  $S^2$ ,

$$\omega = \begin{cases} \frac{dy \wedge dz}{x} & \text{for } x \neq 0 \\ \frac{dz \wedge dx}{y} & \text{for } y \neq 0 \\ \frac{dx \wedge dy}{z} & \text{for } z \neq 0 \end{cases}$$

*Proof.* Define  $f \in \Omega^0(\mathbb{R}^3)$  by

$$f(x, y, z) \triangleq \sqrt{x^2 + y^2 + z^2}$$

So we have

$$df = \frac{\partial f}{\partial x} dx + \frac{\partial f}{\partial y} dy + \frac{\partial f}{\partial z} dz$$

Let  $i : S^2 \rightarrow \mathbb{R}^3$  be the inclusion map. Because  $f \circ i : S^2 \rightarrow \mathbb{R}$  is constant 1, we may compute

$$\begin{aligned}
0 &= d(f \circ i) = d(i^* f) = i^*(df) = i^* \left( \frac{\partial f}{\partial x} dx + \frac{\partial f}{\partial y} dy + \frac{\partial f}{\partial z} dz \right) \\
&= \frac{\partial f}{\partial x} dx + \frac{\partial f}{\partial y} dy + \frac{\partial f}{\partial z} dz \\
&= \frac{x dx + y dy + z dz}{\sqrt{x^2 + y^2 + z^2}} = x dx + y dy + z dz
\end{aligned}$$

This give us

$$\begin{cases} dx = \frac{ydy+zdz}{-x} & \text{for } x \neq 0 \\ dy = \frac{xdx+zdz}{-y} & \text{for } y \neq 0 \\ dz = \frac{xdx+ydy}{-z} & \text{for } z \neq 0 \end{cases}$$

Therefore, for  $x \neq 0$

$$\begin{aligned} \omega &= xdy \wedge dz - ydx \wedge dz + zdx \wedge dy \\ &= xdy \wedge dz - y\left(\frac{ydy + zdz}{-x}\right) \wedge dz + z\left(\frac{ydy + zdz}{-x}\right) \wedge dy \\ &= \left(x + \frac{y^2}{x} + \frac{z^2}{x}\right)dy \wedge dz \\ &= \frac{(x^2 + y^2 + z^2)dy \wedge dz}{x} = \frac{dy \wedge dz}{x} \end{aligned}$$

Similarly, for  $y \neq 0$

$$\begin{aligned} \omega &= xdy \wedge dz - ydx \wedge dz + zdx \wedge dy \\ &= x\left(\frac{xdx + zdz}{-y}\right) \wedge dz - ydx \wedge dz + zdx \wedge \left(\frac{xdx + zdz}{-y}\right) \\ &= \left(\frac{x^2}{y} + y + \frac{z^2}{y}\right)dz \wedge dx \\ &= \frac{(x^2 + y^2 + z^2)dz \wedge dx}{y} = \frac{dz \wedge dx}{y} \end{aligned}$$

Lastly, for  $z \neq 0$

$$\begin{aligned} \omega &= xdy \wedge dz - ydx \wedge dz + zdx \wedge dy \\ &= xdy \wedge \left(\frac{xdx + ydy}{-z}\right) - ydx \wedge \left(\frac{xdx + ydy}{-z}\right) + zdx \wedge dy \\ &= \left(\frac{x^2}{z} + \frac{y^2}{z} + z\right)dx \wedge dy \\ &= \frac{(x^2 + y^2 + z^2)dx \wedge dy}{z} = \frac{dx \wedge dy}{z} \end{aligned}$$

■

**Theorem 1.1.11.** (c) If we orient  $S^n$  in  $\mathbb{R}^{n+1}$  as the boundary of the unit closed ball, then

$$\int_{S^2} \omega = 4\pi$$

*Proof.* Because

$$\omega = i^*(\iota_V d\mathbf{x}^1 \wedge \cdots \wedge d\mathbf{x}^{n+1})$$

And because

$d\mathbf{x}^1 \wedge \cdots \wedge d\mathbf{x}^{n+1}$  is a positively oriented volume form on the unit closed ball

We know  $\omega$  as a volume form of  $S^n$  is also positively oriented. Therefore, when we consider the chart

$$U \triangleq \{(x, y, z) \in S^2 : z > 0\} \text{ and } \varphi(x, y, z) \triangleq (x, y)$$

And the chart

$$V \triangleq \{(x, y, z) \in S^2 : z < 0\} \text{ and } \psi(x, y, z) \triangleq (x, y)$$

According to our computation in part 2, we may integrate

$$\begin{aligned} \int_U \omega &= \int_{\varphi(U)} \frac{1}{\sqrt{1-x^2-y^2}} dx dy \\ &= \int_0^1 \int_0^{2\pi} \frac{r}{\sqrt{1-r^2}} d\theta dr = 2\pi \int_0^1 \frac{r}{\sqrt{1-r^2}} dr = 2\pi (-\sqrt{1-r^2}) \Big|_{r=0}^1 = 2\pi \end{aligned}$$

And integrate

$$\int_V \omega = - \int_{\psi(V)} \frac{1}{-\sqrt{1-x^2-y^2}} dx dy = 2\pi$$

Therefore,

$$\int_{S^2} \omega = \int_U \omega + \int_V \omega = 4\pi$$

#### Question 4

Let  $M$  be a manifold of dimension  $n$ , and  $\{U_i\}_{i \in I}$  be a countable open cover. Suppose that each  $U_i$  is diffeomorphic to  $\mathbb{R}^n$  and all  $U_{ij} \triangleq U_i \cap U_j$  and  $U_{ijk} \triangleq U_i \cap U_j \cap U_k$  are either diffeomorphic to  $\mathbb{R}^n$  or empty. Choose a total order  $<$  on  $I$ , and consider the following sequence of real vector space

$$\mathcal{W}_1 = \prod_{i \in I} \mathbb{R} \xrightarrow{\lambda} \mathcal{W}_2 = \prod_{i < j \in I; U_{ij} \neq \emptyset} \mathbb{R} \xrightarrow{\mu} \mathcal{W}_3 = \prod_{i < j < k \in I; U_{ijk} \neq \emptyset} \mathbb{R}$$

where the linear maps are defined by

$$\begin{aligned}\lambda &: (c_i)_{i \in I} \mapsto (c_i - c_j)_{i < j \in I; U_{ij} \neq \emptyset} \\ \mu &: (c_{ij})_{i < j \in I; U_{ij} \neq \emptyset} \mapsto (c_{ij} + c_{jk} - c_{ik})_{i < j < k \in I; I_{ijk} \neq \emptyset}\end{aligned}$$

which satisfies

$$\mu \circ \lambda = 0$$

- (a) Let  $\alpha$  be a closed 1-form. Show that for each  $i \in I$ , we have  $\alpha|_{U_i} = df_i$  for some smooth function  $f_i : U_i \rightarrow \mathbb{R}$ . Show that there exists a unique element  $(c_{ij})$  in  $\mathcal{W}_2$  with  $f_i|_{U_{ij}} - f_j|_{U_{ij}} = c_{ij}$  for all  $i < j, U_{ij} \neq \emptyset$ . Show that  $\mu((c_{ij})) = 0$ .
- (b) Show that in Part (a), the element  $(c_{ij}) + \text{Im } \lambda \in \text{Ker } \mu / \text{Im } \lambda$  is independent of the choice of  $f_i$ , and depend only on the cohomology class  $[\alpha] \in H^1(M)$ .

From part (a) and (b), one define a linear map  $\Phi : H^1(M) \rightarrow \text{Ker } \mu / \text{Im } \lambda$ .

- (c) Show that  $\Phi$  is injective.
- (d) Suppose  $(c_{ij})_{i < j \in I; U_{ij} \neq \emptyset}$  lies in  $\text{Ker } \mu \subseteq \mathcal{W}_2$ . Choose a partition of unity  $\{\rho_i\}_{i \in I}$  subordinate to  $\{U_i\}_{i \in I}$ . Define function  $f_i : U_i \rightarrow \mathbb{R}$  by

$$f_i \triangleq \sum_{j \in I; i < j, U_{ij} \neq \emptyset} c_{ij} \rho_j|_{U_i} - \sum_{j \in I, j < i, U_{ij} \neq \emptyset} c_{ji} \rho_j|_{U_i}$$

Show that there exists a closed one-form  $\alpha$  such that these  $f_i$  and  $c_{ij}$  are possible choices in part (a). Deduce that  $\Phi$  is surjective.

- (e) Show that if  $M$  is compact, then  $H^1(M)$  is finite-dimensional.

For part (a), note that because

- (i)  $U_i$  is diffeomorphic to  $\mathbb{R}^n$ .
- (ii)  $\alpha$  is closed.
- (iii)  $H^1(\mathbb{R}^n) = 0$  by Poincare Lemma.

There indeed exists smooth  $f_i : U_i \rightarrow \mathbb{R}$  such that  $\alpha|_{U_i} = df_i$ . Fix such  $(f_i)_{i \in I}$ . Observe

that for all fixed  $i < j, U_{ij} \neq \emptyset$ , we may compute

$$d(f_i - f_j) = df_i - df_j = \alpha - \alpha = 0 \text{ on } U_{ij}$$

This implies

$$f_i|_{U_{ij}} - f_j|_{U_{ij}} \text{ is some unique constant } c_{ij} \text{ on } U_{ij}$$

Fix such  $(c_{ij}) \in \mathcal{W}_2$ . To see  $\mu((c_{ij})) = 0$ , fix  $i < j < k, p \in U_{ijk}$ , and compute

$$\begin{aligned} c_{ij} + c_{jk} - c_{ik} &= (f_i - f_j)(p) + (f_j - f_k)(p) - (f_i - f_k)(p) \\ &= (f_i - f_j - f_k + f_k - f_i)(p) = 0 \end{aligned}$$

**Theorem 1.1.12.** (b) The map

$$\alpha \mapsto (c_{ij}) + \text{Im } \lambda \in \frac{\text{Ker } \mu}{\text{Im } \lambda}$$

is well-defined and sends closed one-forms within the same cohomology class to the same element.

*Proof.* Let  $\widehat{f}_i : U_i \rightarrow \mathbb{R}$  also satisfy  $\alpha|_{U_i} = d\widehat{f}_i$ , and again induce

$$\widehat{c}_{ij} \triangleq \widehat{f}_i - \widehat{f}_j$$

Because

$$d(f_i - \widehat{f}_i) = df_i - d\widehat{f}_i = \alpha - \alpha = 0$$

We know  $f_i, \widehat{f}_i$  differ by some constant, which we denote

$$c_i \triangleq f_i - \widehat{f}_i$$

Now, compute

$$\begin{aligned} \lambda(c_i) &= (c_i - c_j)_{i < j \in I; U_{ij} \neq \emptyset} \\ &= (f_i - \widehat{f}_i - f_j + \widehat{f}_j)_{i < j \in I; U_{ij} \neq \emptyset} \\ &= (c_{ij} - \widehat{c}_{ij})_{i < j \in I; U_{ij} \neq \emptyset} \end{aligned}$$

We have shown  $(\widehat{c}_{ij})_{i < j \in I; U_{ij} \neq \emptyset}, (c_{ij})_{i < j \in I; U_{ij} \neq \emptyset}$  differ by  $\lambda(c_i)$ . That is, the map

$$\alpha \mapsto (c_{ij}) + \text{Im } \lambda \in \frac{\text{Ker } \mu}{\text{Im } \lambda} \text{ is well-defined}$$

Let  $\gamma \in \Omega^1(M)$  be some exact one-form. It remains to show

$$(c_{ij}) \in \text{Im } \lambda \text{ where } (c_{ij}) \text{ is induced by } \gamma$$

*depends  
on linearity*

Write  $\gamma = dg$ , where  $g \in \Omega^0(M)$ . Let  $f_i : U_i \rightarrow \mathbb{R}$  satisfy

$$\gamma|_{U_i} = df_i$$

Because

$$d(g - f_i) = dg - df_i = \gamma - \gamma = 0 \text{ on } U_i$$

We know  $g, f_i$  on  $U_i$  differ by some constant, which we denote

$$c_i \triangleq f_i - g \text{ on } U_i$$

Now, to close the proof, compute

$$\begin{aligned} \lambda((c_i)_{i \in I}) &= (c_i - c_j)_{i < j \in I; U_{ij} \neq \emptyset} \\ &= (f_i - g - f_j + g)_{i < j \in I; U_{ij} \neq \emptyset} \\ &= (f_i - f_j)_{i < j \in I; U_{ij} \neq \emptyset} = (c_{ij})_{i < j \in I; U_{ij} \neq \emptyset} \end{aligned}$$

where the last inequality hold because the  $(c_{ij})$  we are referring to is induced by  $\gamma$ . ■

**Theorem 1.1.13.** (c)  $\Phi$  is injective.

*Proof.* Fix  $[\alpha] \in H^1(M)$ , and let  $(f_i : U_i \rightarrow \mathbb{R}), (c_{ij}) \in \mathcal{W}_2$  be induced by  $\alpha$ . Suppose  $(c_{ij}) = \lambda((c_i))$  for some  $(c_i) \in \mathcal{W}_1$ . We are required to show

$\alpha$  is exact

Define  $g_i : U_i \rightarrow \mathbb{R}$  by

$$g_i \triangleq f_i - c_i$$

So if  $i < j$  satisfy  $U_{ij} \neq \emptyset$ , we see

$$g_i - g_j = (f_i - c_i) - (f_j - c_j) = (f_i - f_j) - c_{ij} = 0 \text{ on } U_{ij}$$

Note that the second equality follows from  $(c_{ij}) = \lambda((c_i))$  and the last equality follows from definition of  $(c_{ij})$ . In summary, we have shown

$$g_i = g_j \text{ on } U_{ij}$$

Therefore, we may well define  $g : M \rightarrow \mathbb{R}$  by

$$g(p) \triangleq g_i(p) \text{ if } p \in U_i$$

To close out the proof, observe on each  $U_i$ ,

$$\alpha = df_i = dg_i = dg$$

where the second equality hold because  $g_i, f_i$  differ by a constant. This implies

$$\alpha = dg \text{ on } M$$

We have shown  $\alpha$  is exact. That is,  $[\alpha] = 0$ . ■

You still have to say that  $\Phi$  is linear.

**Theorem 1.1.14.** (d) Let  $(c_{ij}) \in \text{Ker } \mu \subseteq \mathcal{W}_2$  and  $\{\rho_i\}_{i \in I}$  be a partition of unity subordinate to  $\{U_i\}_{i \in I}$ . If we define  $f_i : U_i \rightarrow \mathbb{R}$  by

$$f_i \triangleq \sum_{j \in I; i < j, U_{ij} \neq \emptyset} c_{ij} \rho_j|_{U_i} - \sum_{j \in I, j < i, U_{ij} \neq \emptyset} c_{ji} \rho_j|_{U_i}$$

there exists some closed one-form  $\alpha$  such that  $\alpha = df_i$  on each  $U_i$  and

$$f_i - f_j = c_{ij} \text{ on } U_{ij} \text{ for all } i < j, U_{ij} \neq \emptyset$$

*Proof.* Fix  $i < j, U_{ij} \neq \emptyset$ . Because

$$\begin{aligned} f_i &= \sum_{i < k} c_{ik} \rho_k - \sum_{k < i} c_{ki} \rho_k \\ f_j &= \sum_{j < k} c_{jk} \rho_k - \sum_{k < j} c_{kj} \rho_k \end{aligned}$$

We may compute

$$f_i - f_j = \sum_{j < k} (c_{ik} - c_{jk}) \rho_k + \sum_{i < k < j} (c_{ik} + c_{kj}) \rho_k + \sum_{k < i} (-c_{ki} + c_{kj}) \rho_k + c_{ij} \rho_j + c_{ij} \rho_i \quad (1.3)$$

Because  $(c_{ij}) \in \text{Ker } \mu$ , for all  $k > j$ , we may deduce

$$c_{ij} + c_{jk} - c_{ik} = 0 \implies c_{ik} - c_{jk} = c_{ij}$$

For all  $k : i < k < j$ , we may deduce

$$c_{ik} + c_{kj} - c_{ij} = 0 \implies c_{ik} + c_{kj} = c_{ij}$$

For all  $k < i$ , we may deduce

$$c_{ki} + c_{ij} - c_{kj} = 0 \implies -c_{ki} + c_{kj} = c_{ij}$$

Thus, we may continue the computation from Equation 1.3 and get

$$f_i - f_j = \sum_{k \in I} c_{ij} \rho_k = c_{ij} \text{ on } U_{ij}$$

where the last equality hold true because  $\{\rho_k\}_{k \in I}$  is a partition of unity. We have established that for each  $i < j, U_{ij} \neq \emptyset$ , the functions  $f_i, f_j$  differ by a constant on where they overlap. Therefore, we may well define a closed one form  $\alpha$  on  $M$  by

$$\alpha|_{U_i} \triangleq df_i \text{ for all } i \in I$$

Note that  $\alpha$  is indeed closed, since

$$(d\alpha)|_{U_i} = d(\alpha|_{U_i}) = d(df_i) = 0 \text{ for all } i \in I \implies d\alpha = 0 \text{ on } M$$

■

Now, for all element  $X$  of  $\text{Ker } \mu / \text{Im } \lambda$ , when we pick a representative element  $(c_{ij}) \in X \subseteq \text{Ker } \mu$ , using **Theorem 1.1.14**, we may find some closed one-form  $\alpha$  such that  $\alpha$  can induce  $(c_{ij})$ , which give us

$$\Phi([\alpha]) = X$$

In other words,  $\Phi$  is surjective. For part (e), suppose  $M$  is compact. Because  $M$  is compact, we may let  $I$  be finite, which allow us to deduce

$$\text{Dim}(\mathcal{W}_2) \leq (\text{card } I)^2 \in \mathbb{N}$$

and deduce

$$\text{Dim}(\text{Ker } \mu / \text{Im } \lambda) \leq \text{Dim}(\text{Ker } \mu) \leq \text{Dim}(\mathcal{W}_2) \in \mathbb{Z}_0^+$$

Lastly, because  $\Phi : H^1(M) \rightarrow \text{Ker } \mu / \text{Im } \lambda$  is injective, we can moreover deduce

$$\text{Dim}(H^1(M)) \leq \text{Dim}(\text{Ker } \mu / \text{Im } \lambda) \in \mathbb{Z}_0^+$$

That is,  $H^1(M)$  is finite dimensional.
